

Problem Statement 3: Super App for Unified Multi Asset Investing and Awareness for Retail Investors

Problem

India's retail investors face two compounding barriers that limit effective participation in the securities markets.

First, despite holding investments across multiple demat and trading accounts with different brokers, investors lack a single consolidated view of their total holdings, exposure, and risk. This fragmentation across depositories, brokers, and asset classes creates inefficiencies in portfolio monitoring and impairs informed decision-making. While building blocks such as the Account Aggregator framework and the SEBI-NSDL-CDSL Unified Investor Platform exist, no integrated, analytics-rich solution currently provides a seamless, cross-asset portfolio intelligence experience for retail investors.

Second, retail participation remains heavily skewed towards equities, with limited awareness of and access to alternate investment instruments such as REITs, InvITs, corporate bonds, and other fixed-income products. This concentration is compounded by the lag between financial product innovation and investor comprehension new instruments are regularly introduced, but investor understanding often lags, creating risks of mis-selling, unsuitable investment decisions, and shallow capital market participation. No integrated digital platform currently enables a retail investor to discover, understand, assess suitability for, and invest across multiple asset classes through a single interface.

Together, these gaps result in a fragmented, opaque, and inequitable investing experience where sophisticated portfolio intelligence and multi-asset access remain the preserve of institutional investors and high-net-worth individuals, while retail investors navigate a disjointed ecosystem.

Desired outcome

Participants are invited to design and build an **investor super app** - a secure, unified investment platform that consolidates an investor's holdings across depositories, brokers, and asset classes into a single intelligent dashboard, while simultaneously expanding their awareness of and access to alternate instruments such as REITs, InvITs, corporate bonds, and emerging financial products.

The solution should bring together portfolio aggregation, risk and exposure analytics, and transaction intelligence on one hand, with interactive product education, risk profiling,

suitability assessment, and seamless multi-asset investment access on the other, creating an end-to-end investing experience that is currently available only to institutional and high-net-worth investors, but reimagined for every retail participant in India's securities markets.
